

AEye, a supplier of artificial perception systems, have received a strategic investment from Aisin, the Japanese components and systems manufacturer ranked the N° 6 Tier 1 parts supplier globally, and a premier developer of information and communications technology and electronics for the automotive market. Aisin's investment paves the way for collaboration and expansion as the companies scale to meet the demands of automakers deploying ADAS and mobility solutions.

AEye's "iDAR", for example, combines software extensibility, artificial intelligence, and smart, agile sensors to deliver intelligent data collection at the sensor level. The company's AE110 product features the industry's only software-definable lidar, creating an open platform for perception innovation that lets software engineers optimise data collection to best meet their needs.
