

Auer Lighting have launched an ambitious investment program to expand their plant and equipment portfolio. New kinds of highly complex lighting systems require optimal glass materials and highly precise optics, whether for advanced consumer electronics or for advanced vehicle lighting.

To respond to these needs for increased precision, Auer's multimillion-euro investment program peaked this past month with the installation of highly advanced precision glass moulding equipment. The upgrade of their in-house tool and die department with another fully automated 5-axis CNC machine is next in line.
